Each section 2-4 sentences. End with:

"Disclaimer: This AI summary must be validated by a qualified clinician."

PATIENT:

- Age = 42
- Gender = Female
- Lesion location = forehead

AI FINDINGS:

- ResNet50 prediction = BKL (100.00% confidence)
- Mask R-CNN prediction = Benign Keratosis (90.00% confidence)

CLINICAL REPORT:

****Diagnosis:**** Based on the AI findings, I diagnose the patient with Benign Keratosis of the Forehead (BKL). This is a common and harmless skin condition that can appear as a small, rough bump or patch on the skin.

****Recommended Next Steps:**** Given the diagnosis, I recommend monitoring the lesion for any changes in size, shape, or color. If the lesion becomes itchy, painful, or bleeds, the patient should seek immediate medical attention. Additionally, the patient may consider using topical corticosteroids to reduce inflammation and alleviate discomfort.

****Precautions:**** As BKL is a benign condition, there are no precautions necessary beyond regular monitoring. However, if the lesion becomes cancerous, early detection is crucial, so it's important for the patient to keep follow-up appointments and inform their healthcare provider of any changes.

****Treatment & Lifestyle Advice:**** Topical corticosteroids can help reduce inflammation and alleviate discomfort associated with BKL. However, these treatments should only be used under the guidance of a qualified healthcare professional. Additionally, avoiding excessive sun exposure and using broad-spectrum sunscreen can help prevent further irritation or damage to the skin.
